Display Control Panel /

Graphics Controllerr

96 SHEETS • 5 x 5 QUAD
10⅛ x 7⅞ • 53-110

1984

NATIONAL BLANK BOOK COMPANY, INC.
Holyoke, Massachusetts 01040 • Made in USA

Display Control Panel / Graphics Controller

Memory Panel

4 planes of 512 x 512 pixels -

- each plane may be
cleared
written to
disabled
read

independently -

this organization allows 4 independent monochrome planes -

or combinations of color planes

MICROCIRCUITS DIVISION

RGB DAC 4TD

HYBRID
TRIPLE 4 BIT
COLOR MAPPED VIDEO DAC

DESCRIPTION

This hybrid digital to analog converter provides 3 channels of video output for RGB type video displays with picture element (pixel) rates to 40MHz. The RGB DAC 4TD contains 3 video DAC's and 3 RAM arrays (16 x 14) as well as all control inputs required to generate output waveforms which are compatible with EIA standards RS-170 and RS-343 (see fig. 3).

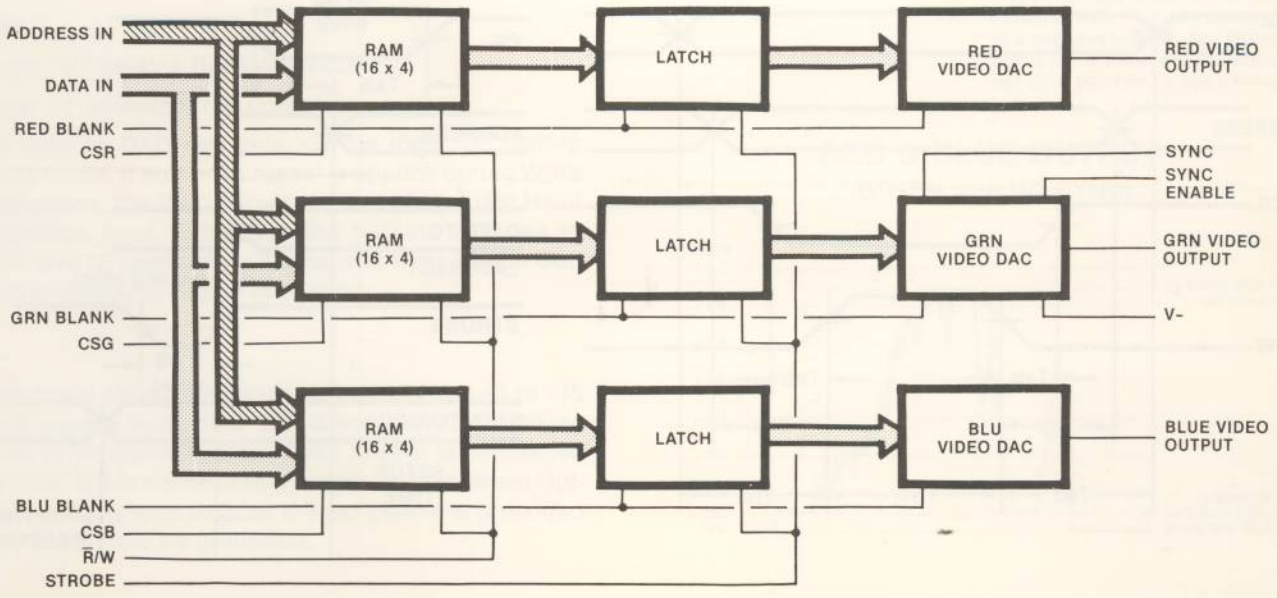
The RGB DAC 4TD provides 4 bits of resolution or 16 levels of "gray scale" per color. This gives the user a $(2^4)^3$ or 4096 color palette. The 16 x 4 ram array per color allows the user a choice of any 16 of the 4096 colors for each sweep. The write speed is also high enough to allow the color map to be updated during the horizontal retrace. The high update rates and the ability to generate a 1 Volt composite video output across the 75 Ohm load makes this DAC ideally suited for color computer graphics using raster scan technology.

FEATURES

- 4096 COLOR PALETTE
- 3 VIDEO DACS
- UPDATE RATES TO 40 MHz
- COMPLETE COMPOSITE VIDEO CAPABILITY
- 16 x 4 BIT COLOR MAP RAM
- TTL COMPATIBLE
- DIRECT 75 OHM RGB OUTPUTS
- CLEAN OUTPUT (Deglitching not required)
- SINGLE +5V SUPPLY
- SMALL SIZE—24 PIN DIP

BLOCK DIAGRAM

FIG. 1



SPECIFICATIONS

(Typical @ +25°C, +5V and 75Ω load unless otherwise stated)

RESOLUTION	4 bits
PALETTE	4096
(max colors per sweep)	16
ANALOG OUTPUTS (each channel)	
Voltage Range (1%)	0 to 0.6 volts
Current (Max)	17 mA
Impedence (±5%)	75 ohms
Compliance	±2 volts
OUTPUT-COMPOSITE SYNC	
Green Only[4] (±5%) (Referred to Blanking Level)	-286 mV
OUTPUT-COMPOSITE BLANKING	
(Referred to Black Level)[4] (±5%)	-50 mV
ACCURACY (Each Channel)	
Absolute	± ½ LSB
Linearity	± ½ LSB
Offset	10 mV
Offset	100 ppm/°C
Gain Tempco	500 ppm/°C
Linearity Tempco	250 ppm/°C
DYNAMIC CHARACTERISTICS (each DAC)	
Settling Time (to 1 LSB)	5 nS
Update Rate	40 MHz
Rise Time	3 nS
Slew Rate	200 V/μs
DATA & ADDRESS INPUTS	
Compatibility	TTL
Coding	BIN

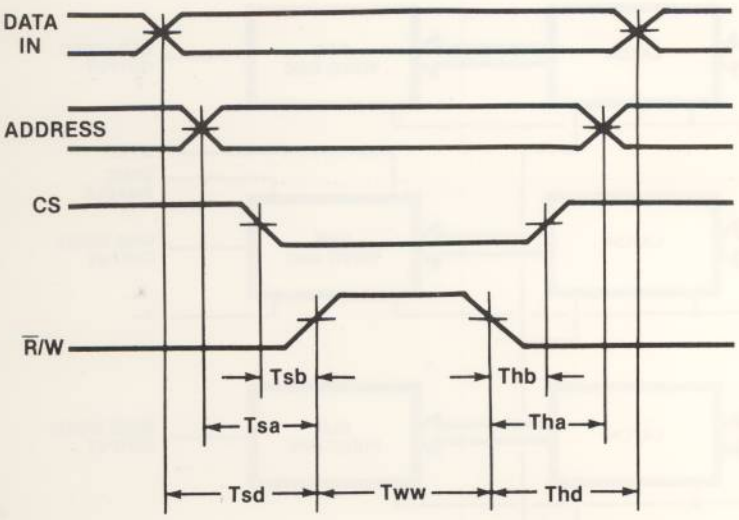
CONTROL INPUTS	
STROBE	
Compatibility	TTL
Set-up Time[1]	25nS
Hold Time (From Valid Address)	0 nS
Propagation	12 nS
COMPOSITE BLANKING SYNC	
Compatibility	TTL
Settling Time	20 nS
DYNAMIC CHARACTERISTICS (each RAM)	
Write Pulse Width (Tww) (min)	25 nS
Address Setup Time[2] (Tsa) (min)	0 nS
Data Setup Time[2] (Tsd)	25 nS
CS Setup Time[3] (Tsb)	25 nS
Address Hold Time[3] (Tha)	0 nS
Data Hold Time[3] (Thd)	0 nS
Chip Select Hold Time[3] (Thb)	0 nS
Address Access Time (Taa) (Max)	20 nS
Chip Select Access Time (Tab)	15 nS
POWER REQUIREMENTS	
Voltage	+4.5 to +5.5 V
Current (Typ)	480 mA
(Max)	580mA
V- Input	
Voltage	-3 to -15 V
Current (Max)	-16 ma
TEMPERATURE RANGE (ambient)	0 to 70 degrees C

NOTES: 1. Time from stable "Read Address' to Strobe Hi to Lo Transition.
2. Lo to Hi R/W Transition
3. Hi to Lo R/W Transition.
4. See Figure 3.

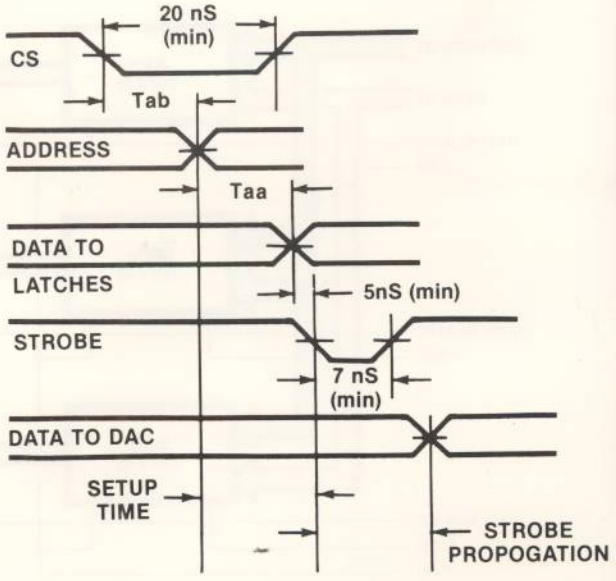
TIMING DIAGRAMS

FIG. 2

WRITE CYCLE



READ CYCLE



PIN DESCRIPTIONS

STROBE

The transition from Logic "1" to Logic "0" transfers data from RAM outputs to the Data Register outputs (DAC inputs). The Strobe is not used for Write operations.

GREEN SYNC (Composite Sync)

A Logic "1" sets the registers to all "0's" (Ref Black) and drives the Green output to a level 286mV more negative than the Reference Blanking level. This signal has priority over Blanking and Data Inputs from the RAM's and is used to synchronize the beam traces in a Raster Scan type display.

BLANKING (Red, Grn, Blu)

A Logic "1" sets the registers to all "0's" (Ref Black) and drives the output to a level 50mV more negative than the Reference Black level. This signal has priority over the Data Inputs from the RAM's and is used to shut off the beam for the darkest display possible.

SYNC ENABLE

This input should be connected to +5V to enable the Sync Signal feature of the Green Output. If this feature is not desired this input should be connected to ground.

ADDRESS-4 Bits-A_0, A_1, A_2, A_3

Determines Read or Write Address for all RAM arrays. These inputs are used as an Address Input to load arrays in the Write mode. During the Read mode display colors are obtained by addressing the appropriate memory locations and transferring the memory data to the DACs.

DATA-4 Bits-D_0, D_1, D_2, D_3

Used to load data to all RAM arrays-Data loaded will be non-inverted to the DAC during Read Mode.

$\overline{R/W}$

Logic "O" selects Read operation.

Logic "1' selects Write operation.

All data to DAC registers will be logic "1" during Write mode. If no strobe signal is applied during Write operations, the DAC outputs will retain the last Read operation level. Otherwise the outputs will rise to REF WHITE level unless Composite Sync (Green Output) or Blanking Signal is applied.

V-

This input should be connected to a stable -3 to -15 Volt supply to restore the Green Output Blanking level to 0V absolute if the Sync Enable is connected to +5V. If it is not necessary to restore the Green Output blanking level to 0V or if Sync Enable is grounded this pin should be grounded.

$\overline{CSR}$, $\overline{CSG}$, $\overline{CSB}$

Chip select for each channel (Red, Green, or Blue). A logic "0" selects RAM channel for Read or Write operations and a "1" deselects RAM for any operation. If deselected, the data to the DAC registers will be logic "1". If no strobe signal is applied while the RAM is deselected DAC outputs will retain the last "Read" operation level. Otherwise the output will rise to REF WHITE level unless Composite Sync (Green Output) or Blanking Signal is applied. Normally only one input is enabled (logic "0") to Write data to its corresponding RAM and all inputs are enabled (logic "0") to read data during display.

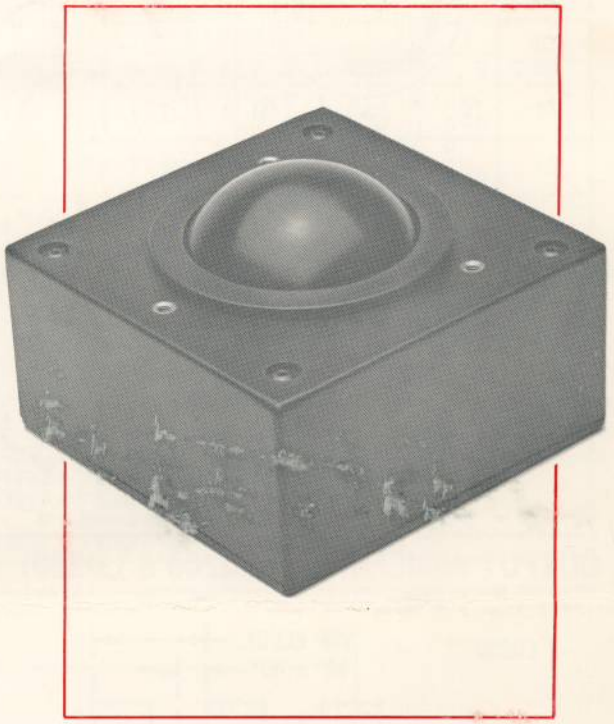
200 SERIES

LOW COST 2" TRACKBALL

DISC'S 200 SERIES Trackballs are the low cost answer to enhance computer or graphics terminal performance by providing accurate X, Y cursor positioning on a CRT screen. Replacing conventional joysticks and their A to D conversion electronics to achieve digital outputs, the LD200 and the LQ200 deliver direct digital outputs configured as direction decoded pulses or quadrature square wave that are CMOS/TTL compatible. The LS200 version in the series provides for 3 optional external switch inputs and delivers a serial binary output with RS232C or CMOS/TTL interface. Sized to be keyboard or panel mounted, or used for standalone and remote applications, DISC'S 200 SERIES Trackballs are ideal for business and personal computers, CAD/CAM, video games, graphic terminals, radar monitor systems or anywhere man/machine X, Y interface is required. With a 2" ball, a mere 3.25" square and a slim 1.5" depth, the 200 is a space saving alternative to the mouse or bit pad. Drawing on more than 15 years of optical encoder manufacturing experience, DISC offers trackballs of incomparable performance and features.



SPECIFICATIONS

ELECTRICAL

Interface:	
LD or LQ200	CMOS/TTL
LS200	RS232C or CMOS/TTL
Resolution (PPR)	192 +/−5%
Output Signal:	
LQ200	Quadrature Square Waves
LD200	5μsec+/−30% Pulses, Direction Decoded
LS200	Serial Binary (See Format Description)
Input Power:	
RS232C	+5VDC @ 100 ma. max. and +12VDC @ 30 ma. max. and −12VDC @ 30 ma. max.
CMOS/TTL	+5VDC @ 100 ma. max.
Output Driver:	
RS232C	SN75150
CMOS/TTL	"1" 3.0V min. @ 3 ma. source, "0" 0.4V max. @ 3 ma. sink
Connector (Socket)	8 Pin telephone modular, locking female
Mating Plug	8 Pin telephone modular, locking male (not furnished with unit)

MECHANICAL

Weight	8.0 oz. max. (230 gm)
Ball	Thermoset Phenolic, 2" dia. black (51mm)
Tracking Force	1.5 oz. max., 0.7 oz typ. (20gm)
Ball Load	100 lbs. max. downward (45 Kg)
Ball Rotation	Continuous & reversible any direction
Ball Speed	200 RPM maximum
Housing Material	ABS (Cycolac KJT) Black
Transducers	Photo-optical Encoders with LEDs
Mounting Position	Horizontal to 30 degrees rear elevation

ENVIRONMENTAL

Temperature:	
Storage	−25 degrees C to +60 degrees C
Operating	+5 degrees C to +50 degrees C

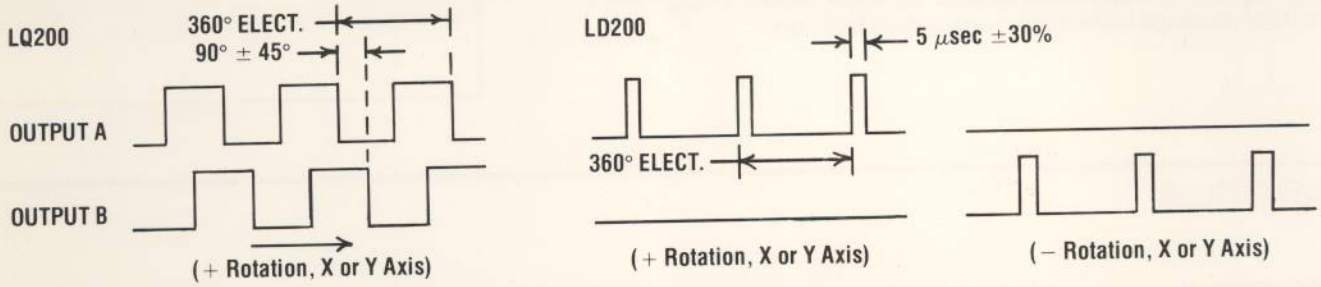
OUTPUT WAVEFORMS (LQ200 & LD200)



OUTPUT FORMAT DESCRIPTION (LS200)

The LS200 is the serial output version of the 200 SERIES trackball incorporating a custom IC chip that converts conventional incremental quadrature encoder inputs to a single serial binary data stream. Pulses from each axis encoder are counted during a period which is approximately equivalent to the reciprocal of the data block rate. The resultant X and Y counts and (if used) the switch data are loaded into buffer registers during the first output start pulse. The registers then reset to zero and counting is immediately resumed; no pulse goes uncounted.

The output formats available are shown in the timing diagram examples for the 2 word and 3 word options. Blocks of data are transmitted only when an encoder count pulse occurs or a switch input transitions from high to low. When there is no input data change to the serial chip following the last transition there is no output signal and the line remains at logic "1". The X and Y change of position count is a two's complement binary number appearing in the first and second 8 bit words. Word length is always 8 bits but the format differs for 2 word versus 3 word. Each count word consists of either 6 or 5 bits of count followed by 1 bit of direction and then 1 or 2 bits of data indentification respectively. The 3 word format must be used if there are switch inputs. The switch word consists of 3 bits of switch status followed by 3 logic "0" bits and the 2 bits identifying the word as switch data.

The serial chip has a 1.8 MHz clock from which several baud rates can be derived with an accuracy of +/−0.1%. The data block length may be either 128 or 256 bits and is a parameter usually determined by the user's system requirements. Baud rate, count length and data block length are customer specified and set at the factory. The output interface can be either RS232C with negative logic ("1" being −6 volts and "0" being +6 volts) or direct CMOS/TTL in +5 volt positive logic.

        ;       *       MONDEB - 09  -  a monitor/debugger           *
        ;       *               for the 6809  microprocessor         *
        ;       *                                                    *
        ;       ******************************************************
        ;
        ; author:       Don Peters      (6800 version)
        ; date:         April 1977
        ;
        ; modified for the 6809
        ; by:           Alan R. Baldwin
        ; date:         Nov 1988
        ;
        ;         This 6809 monitor/debugger does not use the
        ;       direct page addressing mode.  Thus the user
        ;       program has complete control of the page
        ;       assignment and may use the monitor routines
        ;       without concern for variable locations.
        ;
        ;         To add user functions to MONDEB - 09
        ;
        ;       1) add your commands to the end of command list #1
        ;       2) add the command entry points to the jump table
        ;       3) append any local command lists after MONDEB's
        ;       4) provide an external initialization routine to
        ;               set up the console (and/or alternate)
        ;               ports and any other start up processing.
        ;          MONDEB will call 'userinit' if inituser = 1.
        ;
